Bushfire Management Plan
(Development Application)

Willowbrook Farm Caravan Park
Lot 7 Gingin Brook Road, Gingin

Shire of Gingin

Project Number: 15382-1

Assessment Date: 17 October 2016

Report Date: 19 October 2016
Plan Details

This Bushfire Management Plan (the Plan) meets the requirements of both the State Planning Policy No. 3.7: Planning in Bushfire Prone Areas (SPP 3.7) and the supporting Guidelines for Planning in Bushfire Prone Areas (WAPC 2015; the ‘Guidelines’).

**Disclaimer**

The measures contained in this Bushfire Management Plan are considered to be minimum standards and they do not guarantee that a building will not be damaged in a bushfire. This is substantially due to the unpredictable nature and behaviour of fire and extreme weather conditions. Additionally, the achievement of and level of implementation of bushfire management measures will depend, among other things, on the actions of the landowners or occupiers over which Bushfire Prone Planning has no control.

All surveys, forecasts, projections and recommendations made in this report associated with the project are made in good faith on the basis of information available to Bushfire Prone Planning at the time.

All maps included herein are indicative in nature and are not to be used for accurate calculations.

Notwithstanding anything contained therein, Bushfire Prone Planning will not, except as the law may require, be liable for any loss or other consequences (whether or not due to the negligence of their consultants, their servants or agents) arising out of the services provided by their consultants.

1 Executive Summary

This Bushfire Management Plan (the Plan) has been prepared for Burgess Design Group for the proposed development application of the Willowbrook Caravan Park, Gingin located within the Shire of Gingin. Willowbrook Farm Caravan Park’s proposed development is for an extension to the current facilities (4 new Chalets and 131 new Caravan Sites).

The development site 1679 (Lot 7) Gingin Brook Road is 16.07 ha in size with the proposed development area being 4.9 ha. The site is situated on the southern side of Gingin Brook Road and sits within a General Rural Zone (Shire of Gingin Local Planning Scheme 9). The development site is within a designated bushfire prone area and the Proposal requires the application of State Planning Policy No. 3.7: Planning in Bushfire Prone Areas (SPP 3.7). The assessed bushfire risk is considered to be manageable and will be achieved by the identified stakeholders implementing and maintaining the bushfire risk management measures that are presented in this Plan.

Determined BAL ratings of BAL-12.5 are able to be achieved for the proposed construction of 4 Chalets as a part of the overall caravan park extension. All of the proposed caravan sites are within an indicative BAL Rating of BAL 29 or less and do not require the application of the construction standards.

An Emergency Access Way will be developed from the proposed development in a southerly direction to Harriss Road. The Emergency Access Way will provide for alternate access/egress to/from the site in the event of a bushfire emergency.

Guidance is also provided in a separate report with regards to the creation of an emergency evacuation plan, with specific consideration to the management of a bushfire emergency.
2 Application of SPP 3.7

The *State Planning Policy No. 3.7: Planning in Bushfire Prone Areas* (SPP 3.7) provides the foundation for land use planning to address bushfire risk in Western Australia.

This Proposal must consider SPP 3.7 and, if required, comply with its policy measures. The determination of this requirement is presented below.

**Application of SPP 3.7 Policy Measures – Primary Triggers**

- The subject Proposal is a higher order strategic planning document, a strategic planning proposal or a subdivision or development application: ✔
- The project site is located in a designated bushfire prone area on the WA Map of Bushfire Prone Areas: ✔
- The project site is not located in a designated bushfire prone area on the WA Map of Bushfire Prone Areas but the existing vegetation type and condition dictate that it should be:
- The project site is located in an area not yet designated as bushfire prone but is proposed to be developed in a way that introduces a bushfire hazard (*Guidelines for Planning in Bushfire Prone Areas WAPC 2015 s3.2.2*):

**Application of SPP 3.7 Policy Measures – Secondary Trigger/s**

- The Proposal is a strategic planning proposal, subdivision or development application relating to land that has or will have a Bushfire Hazard Level above low and/or where a Bushfire Attack Level rating above BAL-LOW applies (SPP 3.7 s6.2): ✔
- The subject Proposal is a development application for the construction or/and use of a single house or ancillary dwelling on a lot or lots greater than 1100m² and subject to BAL-40 or BAL-FZ (LPS Amendment Regulations 2015):
- The subject Proposal is a development application for the construction or/and use of a habitable building (other than a single house or ancillary dwelling), or a specified building on any lot size and subject to a BAL rating above BAL-LOW (LPS Amendment Regulations 2015):
3 Commissioning and the Land Use Proposal

Bushfire Prone Planning (BPP Group Pty Ltd) has been commissioned to carry out the assessments and prepare the required bushfire planning documentation to accompany the proponent’s planning submission associated with their proposed land use project.

4 The Planning Submission and the Documents Required

Policy measures in SPP 3.7 (and further instruction in the associated document Guidelines for Planning in Bushfire Prone Areas WAPC 2015) set out the bushfire planning information (including bushfire risk assessments) that are to accompany a planning submission. It is dependent on the type of proposal and stage of the development process. In most circumstances this information is to be presented in the form of a Bushfire Management Plan (BMP).

<table>
<thead>

This Bushfire Management Plan will include the information indicated by the check mark. If an item is checked it is required by either: SPP 3.7 or by a local government variation. It may also have been prepared at an earlier planning stage and therefore re-included or included by the assessor as it improves the information presented in this Bushfire Management Plan.

</tr>
</tbody>
</table>

Note that for vulnerable and high risk land uses involving Class 4 to Class 9 buildings, the planning process focuses on location, siting, vehicular access and firefighting water supply and not building construction requirements - as the Building Code of Australia only applies to Classes 1, 2, 3 and associated Class 10a buildings or decks. However, the construction requirements as set out in AS 3959 – 2009 can be utilised voluntarily to enhance a buildings survivability if it is subject to a bushfire.
5 Assessment of Bushfire Risk

5.1 Vegetation Identification and Classification

5.1.1 Existing Vegetation

All vegetation within 100 metres of the subject site has been identified and classified or excluded and presented in Table 5.1.1. This has been done with accordance with AS 3959-2009 and reference to the Visual Guide for Bushfire Risk Assessment in WA (WAPC February 2016).

The vegetation has been assessed as it will be in its mature state and where deemed appropriate, in its unmanaged state. The areas of classified vegetation that will determine bushfire risk are defined on the topography and vegetation map Figure 5.1. Representative photos of each vegetation area is presented after the table.

Table 5.1.1: Vegetation types identified, the applied classification and effective slope

5.1.2 Vegetation Excluded from Classification

Certain areas and vegetation within 100m of the subject site may be assessed as ‘low threat or non-vegetated’. These are to be excluded from classification and are therefore rated BAL-LOW. They must be managed to maintain the specifications set out in AS3959-2009 s2.2.3.2 in perpetuity (refer to Appendix 3 ‘Vegetation Classification Exclusions’).

Managed gardens and grounds surrounding the caravan park have been excluded from classification as presenting a low bushfire threat as per AS 3959-2009s2.2.3.2 (f)

5.1.3 Expected On-site Vegetation Changes Due to Development

In assessing vegetation for bushfire threat, consideration must be given to possible future vegetation changes likely on the site that is being assessed and in particular those that would have the potential to increase the bushfire risk.

This may be due to growth of existing vegetation or growth of planned landscape plantings, including future roadside or water course re-vegetation. In particular, there must be careful consideration of the creation of vegetation corridors where they join offsite vegetation and may provide a route for fire to enter an area of future development.

For this Proposal the future onsite vegetation has been considered and is expected to be maintained as “low threat” with a BAL rating of BAL-LOW. It will meet AS 3959-2009 s2.2.3.2 requirements (refer Appendix 3 ‘Vegetation Classification Exclusions’).

Any future revegetation works or plantings that have the potential to become a bushfire risk will be maintained in accordance with AS 3959-2009 s2.2.3.2 requirements.

Refer to Appendix 2 ‘Bushfire Risk Management – Understanding the Methodology’, for a summary of the BAL assessment procedures.

**A BAL Contour Map (WAPC Factsheet “BAL Contour Maps” Version 2 January 2016)**

“A Bushfire Attack Level (BAL) Contour Map is a scale map of a development site including the proposed (or existing) lot layout, which identifies indicative BAL ratings across the development site and within the immediate surrounding area. A BAL Contour Map illustrates potential bushfire attack levels and radiant heat impacts in relation to any classified vegetation that will remain within 100 metres of the assessment area once development is completed. A BAL Contour Map identifies land suitable and unsuitable for development and guides the location of building envelopes within a development site”.

**The Assessment (WAPC Factsheet “BAL Contour Maps” Version 2 January 2016)**

“A BAL Contour Map is based on an assessment of the development site and surrounding area as they will be when the proposed development is constructed i.e. when the land has been cleared and all the subdivision works have been undertaken. It needs to take into account any vegetation that will remain or will be introduced when the works are complete”. Refer to Appendix 1 ‘Bushfire Risk Management – Understanding the Methodology’, for a summary of the BAL assessment procedures.

**Map Interpretation**

The contour map will present different coloured contours constructed around the classified bushfire prone vegetation. These represent the different Bushfire Attack Levels (BAL’s) that exist as the distance increases away from the classified vegetation. Each BAL represents a set range of radiant heat flux (refer to Appendix 2) that can be generated from the vegetation. The width of each shaded contour then is a result of calculations involving vegetation type, fuel structure, ground slope, and climatic conditions (i.e. the expectations of fire behaviour) and are unique to a given site – and can potentially vary across a site.
The Contour Map and ‘Class G Grassland’

Grassland vegetation types may have been identified and classified on the subject site (refer to the Vegetation and Topography Map in Figure 5.1). Where this is the situation for the subject Proposal, and it is considered appropriate by the assessor, the BAL contour map produced for this Plan will exclude the area of Class G Grassland. Therefore, the displayed BAL contours will exist for all classified vegetation types except Grassland.

The rationale for this approach is to be able to derive meaningful information from the contour map. If Grassland was to be contoured the entire mapped area could potentially be BAL-FZ and therefore be presented as a sole colour – providing no useful information.

Grassland is commonly not native vegetation. From a practical perspective it can be easily managed to a low bushfire threat state and generally will not require approval for its removal. Section 7.3 of this Plan details the management measure required to reduce any classified Grassland to a BAL rating of BAL-Low.

5.2.1 BAL’s as Indicated and Determined by the Contour Map

**BUSHFIRE PRONE PLANNING’S INTERPRETATION AND USE GUIDE**
(of information derived from the BAL Contour Map)

The Primary Use of BAL Contour Mapping - Planning

BAL contour mapping is primarily a planning tool that is able to give an overview as to the suitability of a site for development with respect to the extent to which bushfire is a potential threat to future buildings and persons on the subject land.

The mapping considers the development site as a whole (i.e. all existing or proposed lots) and does not consider the bushfire risk at an individual lot level and over different development time frames. Rather it is assessing the situation that will exist when the entire development has been completed, including any vegetation management that would reasonably be expected to take place as part of establishing buildings on the lots. On this basis it helps decision makers determine the suitability of the proposed development for planning approval.

As a result, there will be situations where, for the purposes of planning, classifiable vegetation is not contoured. However, at a specific point in time (prior to full completion of a development) this vegetation may impact on a proposed buildings BAL rating.

A Secondary Use of BAL Contour Mapping - Building

Building approval (and the issue of a building permit) requires that a BAL rating is determined for an actual building and not just a lot or a building envelope (i.e. an ‘area’). Determination of this BAL rating must consider the actual location of a building within an individual lot and its separation distance from any classified vegetation at the actual time of applying for building approval. It is a site specific assessment based on the buildings design and location at a given point in time.

This specific assessment (BAL report and BAL certificate) required for a building application cannot always be derived from an assessment that is primarily designed to inform planning decisions. As a result, there are limitations to obtaining a single BAL rating for a future building of unknown location, from a BAL contour map assessment (unless the assessment has been conducted for a single lot or building).

Nonetheless, there are limited specific situations where the required building application information (i.e. BAL Certificate) might be obtained quickly and cost effectively from a BAL contour map assessment. When these ‘determined’ BAL’s are able to be derived is explained on the following page.
Indicative BAL’s
If the assessed BAL for a lot or building envelope (the ‘area’) is stated as being ‘indicative’, it is because that ‘area’ is impacted by more than one BAL contour and/or classifiable vegetation remains on the lot, or on adjacent lots, that can influence a future building’s BAL rating (and this vegetation may have been omitted from being contoured for planning purposes e.g. Grassland or when the assumption is made that all onsite vegetation can be removed and/or modified). In this report the indicative BAL is presented as either the highest BAL impacting the ‘area’ or as a range of achievable BAL’s within the ‘area’.

The BAL rating that will apply to any future building within that ‘area’ will be dependent on:

1. vegetation management onsite; and/or
2. vegetation remaining on adjacent lots; and/or
3. the actual location of the future building within that ‘area’.

A BAL Certificate cannot be provided for future buildings within an ‘area’ with an indicative BAL until the location of any future building has been determined and a subsequent onsite BAL assessment conducted and appropriate report produced (which may reference the contour map or be a standalone BAL assessment and report).

Determined BAL’s
If the assessed BAL for a Lot or building envelope (the ‘area’) or existing building, is stated as being ‘determined’ it is because that ‘area’ or building is impacted by a single BAL contour, as determined by offsite classified vegetation, and no classifiable vegetation currently exists on the lot or on adjacent lots (i.e. it has been cleared to a minimal fuel, low bushfire threat state).

As a result, a determined BAL will only be able to be provided in the limited situations where:

1. No classified vegetation is required to be removed or modified to achieve the determined BAL—either within the lot or on adjacent lots (or if vegetation is excluded from classification, it is reasonable to assume it will be maintained in this state into the future); and
2. A future building can be located anywhere within the ‘area’ and be subject to the determined BAL rating; and
3. The degree of certainty is more than sufficient to allow for any small discrepancy that might occur in the mapping of the contours.

A BAL Certificate (referring to the BAL Contour Map assessment) could be provided for a future building on those ‘areas’ assessed as having a determined BAL.

(Note: The only limit to an assessed determined BAL being valid for a future building is if significant time has passed since the original assessment and the vegetation assessment may need to be updated. Aa actual BAL Certificate is only valid for 12 months).
As the building works have been located on the lot, the BAL that the proposed chalets will be exposed to is able to be determined from the contour map. The determined BAL’s for the buildings on the lot are presented in Table 5.2.1.

**Table 5.2.1: Proposed Chalets – Determined BAL**

| Relevant Fire Danger Index (AS3959-2009 Table 2.1) | 80 |

**BAL Determination Method**
Method 1 as per AS 3959-2009 s2.2.6 and Table 2.4.3. Refer to Appendix 2 this Plan.

---

**15382-1 Willowbrook Caravan Park (BMP)_v1.1©2016 BPP Group Pty Ltd**
5.2.2 Identification of Specific Issues Arising from BAL Contour Map

**Onsite Vegetation**
Vegetation onsite is within the control of the subject site’s landowner and therefore can potentially be removed or modified to lower the bushfire risk, subject to any approval being required by a local government.

**Offsite Vegetation**
Vegetation offsite is not within the control of the subject site’s landowner and therefore the vegetation cannot be removed or modified by the landowner and as a result the assessed BAL’s determined by this vegetation are unable to be reduced.

The BAL contour map indicates that all of the existing buildings and all of the proposed chalets are subject to a BAL rating of BAL- 12.5. All of the proposed caravan sites have an indicative BAL rating of BAL 29 or less.
6 Environmental Considerations

“Many bushfire prone areas also have high biodiversity values. SPP 3.7 Policy objective 5.4 recognises the need to consider bushfire risk management measures alongside environmental, biodiversity and conservation values” (‘Guidelines’ s2.3).

“Clearing of native vegetation in Western Australia requires a clearing permit under Part V, Division 2 of the Environmental Protection Act 1986 unless clearing is for an exempt purpose. Exemptions from requiring a clearing permit are contained in Schedule 6 of the Act or are prescribed in the Environmental Protection Regulations” (‘Guidelines’ s2.3).

6.1 Native Vegetation and Re-vegetation

Establishing development in bushfire prone areas can adversely affect the retention of native vegetation through clearing associated with the creation of Asset Protection and Hazard Separation Zones. Where loss of vegetation is not acceptable or causes conflict with landscape or environmental objectives, it will be necessary to consider available options to minimise the removal of native vegetation.

Does this planning proposal satisfy bushfire protection requirements within the boundaries of the land being developed so as not to impact on the bushfire and environmental management of neighbouring reserves, properties or conservation covenants? Yes
7 Bushfire Risk Management Measures

7.1 The Bushfire Protection Criteria – Assess and Demonstrate Compliance

*State Planning Policy 3.7 Planning in Bushfire Prone Areas (Dept. of Planning and WAPC 2015)* requires an assessment against the bushfire protection criteria requirements (contained in the ‘Guidelines’) to accompany any strategic planning proposal, subdivision application or development application.

Strategic planning proposals need to demonstrate that compliance can be achieved in subsequent planning stages. Subdivision and development applications must demonstrate compliance within the boundary of the subject site or provide justification for those criteria that are not able to be fully met.

The criteria are divided into four elements location, siting and design, vehicular access and water. Each element has an intent outlining the overall aim. The acceptable solutions provide examples of how that intent might be met. The performance principle allows for ‘alternative solutions’ to be developed where the acceptable solutions cannot be achieved”. Source: Guidelines for Planning in Bushfire Prone Areas WAPC 2015 (s4.5 and Appendix 4).

Bushfire Prone Planning presents all components of the Bushfire Protection Criteria assessment as a separate table for each element. This includes the intent, the performance principle, a stated level of compliance with the acceptable solutions for each of the criteria and statements that demonstrate the compliance and provide justification for those that have not been fully met.

### Bushfire Protection Criteria - Element 1- Location

**Intent:** To ensure that strategic planning proposals, subdivision and development applications are located in areas with the least possible risk of bushfire to facilitate the protection of people, property and infrastructure.

**Performance Principle P1 (used to develop alternative solutions):** The intent may be achieved where the strategic planning proposal, subdivision or development application is located in an area where the bushfire hazard assessment is or will, on completion, be moderate or low OR a BAL-29 or below applies AND the risk can be managed. For minor or unavoidable development in areas where BAL-40 or BAL-FZ applies, demonstrating that the risk can be managed to the satisfaction of DFES and the decision maker.

<tr>
<td>A1.1 Development Location</td>
<td>The strategic planning proposal, subdivision and development application is located in an area where the bushfire hazard assessment is or will, on completion, be moderate or low <strong>OR</strong> The development is subject to BAL-29 or below.</td>
<td>Land is most suitable for land use intensification where hazard levels are low. Where there is an extreme bushfire hazard level or requirements for use of BAL-40 or BAL-FZ construction standards, the land is not considered suitable for development unless it meets the definition of minor or unavoidable development (which requires WAPC, DFES and local planning approval).</td>
<td>Fully Complies</td>
</tr>
</tbody>
</table>

The proposed development is located within a designated bushfire prone area.

By implementing the positioning and vegetation management measures identified in this Plan the proposed development can meet the acceptable solution of being subject to BAL-29 or below. It does not require the use of BAL-40 or BAL-FZ construction standards.
**Bushfire Protection Criteria - Element 2 - Siting and Design of Development**

*Intent:* To ensure that the siting and design of development (*note: not building/construction design*) minimises the level of bushfire impact.

*Performance Principle P2 (used to develop alternative solutions):* The intent may be achieved where the siting and design of the strategic planning proposal, subdivision or development application, including roads, paths and landscaping, is appropriate to the level of bushfire risk that applies to the site. That it minimises the bushfire risk to people, property and infrastructure, including compliance with AS3959 if appropriate.

</table>
| **A2.1 Asset Protection Zone (APZ)** | The APZ is a low fuel area immediately surrounding a habitable or specified building. All requirements in A2.1 are essential and must be achieved to ensure compliance. If the implementation of protection zones was to result in the loss of vegetation that is not acceptable or causes conflict with landscape and environmental objectives, then the development may need to be modified. | **Fully Complies** | The proposed development meets the acceptable solution: This is achieved by:  
- Incorporating an APZ, to the extent possible within the boundary of the lot, into the landscaping surrounding the proposed/any future building work and maintaining it to comply with specified requirements into the future;  
- The extent of the APZ being established within the boundary of the lot results in the potential radiant heat impact of a fire on the proposed building work not exceeding 29kW/m² (this will result in greater than the minimum 20 m separation distance on all sides of the building). |

Every building is surrounded by an Asset Protection Zone (minimum of twenty metres wide), depicted on submitted plans, which meets the defined requirements.

**OR**

Where a full 20 metre APZ is not possible the APZ should be sufficient enough to ensure the potential radiant heat impact of a fire does not exceed 29 kW/m².

The specifications for the establishment and maintenance of the APZ are stated in Appendix 4 and Appendix 3.
### Bushfire Protection Criteria - Element 2 - Siting and Design of Development (continued)

| **Either or both solutions to be met to the extent that it satisfies Element 1.** | Hazard separation should be provided between extreme bushfire hazards and buildings to create a combined separation distance of 100m (50m for unmanaged grassland) in order to protect them from burning embers, radiant heat and direct flame contact. The minimum hazard separation distance may be reduced by compliance with AS 3959 which requires that as the distance from the vegetation is reduced, the construction standard must be increased. | **Fully Complies** | The proposed development meets the acceptable solution by:  
- The determined BAL not exceeding BAL-29;  
- Applying the construction standard corresponding to the determined BAL rating as per AS 3959-2009 |

**A2.2 Hazard Separation Zone (HSZ)**  
Every building and its contiguous APZ is surrounded by a Hazard Separation Zone (minimum of 80 metres wide), depicted on submitted plans, that meets the defined requirements.  
**OR**  
A HSZ may not be required if the proposed construction meets the standard appropriate to the BAL for that location and the determined BAL does not exceed BAL-29.

The specifications for the establishment and maintenance of the HSZ are stated in Appendix 4.
### Bushfire Protection Criteria - Element 3 - Vehicular Access

**Intent:** To ensure that the vehicular access serving a subdivision/development is available and safe during a bushfire event.

**Performance Principle P3 (used to develop alternative solutions):** The intent may be achieved where the internal layout, design and construction of public and private vehicular access and egress in the subdivision /development allow emergency and other vehicles to move through it easily and safely at all times.

<table>

</table>
| **A3.5 Private Driveways**  
Are required where a house is >50m from a public road. Passing bays @ 200m, turnaround area @ 500m and within 50m of house. Bridges/culverts to support 15t. All weather surface. Constructed to meet the technical requirements stated in Appendix 5. | | Will Fully Comply | The private driveway is >50m in length and will comply with the technical requirements of the guidelines shown in Appendix 5. |
| **A3.6 Emergency Access Way**  
Provided as a right of way or public access easement in gross (maximum length of 600m) to ensure accessibility to the public and fire services in emergencies. It should comply with minimum standards for a public road and be signposted. Constructed to meet the technical requirements stated in Appendix 5. | An access way that does not provide through access to a public road is to be avoided in bushfire prone areas. Where no alternative exists this will need to be demonstrated by the proponent. It is to be provided as an alternative link to a public road during emergencies. | Will Fully Comply | An Emergency Access Way will be developed from the proposed development in a southerly direction to Harriss Road.  
*Note: The Emergency Access Way crossing over the winter creek will use the existing 2.4-metre-wide culvert to minimise environmental damage to the riparian zone.* |
| **A3.7 Fire Service Access Routes - (perimeter roads)**  
Provided as rights of way or public access easements in gross; all weather surface and allow for two-way traffic; dead-end roads not permitted; turnarounds every 500m; less than 600m to a public road and be signposted. Constructed to meet the technical requirements stated in Appendix 5. | Fire service access routes should be established to separate bushfire prone areas from developed areas and to provide access within and around the edge of the subdivisions and related development. To be used during bushfire suppression operations and prevention work. | N/A | |
| **A3.8 Firebreak Width**  
Lots greater than 0.5 hectares must have an internal perimeter firebreak of a minimum width of three metres or to the level prescribed in the local firebreak notice issued by the local government. | | Fully Complies | The lot will comply with the requirements of the local government annual firebreak notice issued under s33 of the Bush Fires Act 1954. |
Bushfire Protection Criteria - Element 4 – Water

**Intent:** To ensure water is available to the subdivision, development or land use to enable people, property and infrastructure to be defended from bushfire.

**Performance Principal P4 (used to develop alternative solutions):** The intent may be achieved where the subdivision, development or land use is provided with a permanent and secure supply that is sufficient for firefighting purposes.

</table>
7.2 Location of Buildings and Applicable BAL’s

Future buildings on the proposed lots are to be located in areas where an appropriate Bushfire Attack Level rating can be achieved and where minimal removal of valuable existing native vegetation is required to achieve this rating. The intent is to have the subject land of this Proposal located in an area where the bushfire hazard level is, or will on completion, be moderate or low or be subject to a maximum Bushfire Attack Level of BAL-29.

The proposed subdivision is unlikely to be approved if the indicative BAL rating for future buildings on any proposed lots is either BAL-40 or BAL-FZ as it is unacceptable on planning grounds. The exception will be if it meets the definition of unavoidable development (‘Guidelines’ s5.4 and s5.7). If this applies the appropriate additional assessment and input from the relevant authorities, if required, is included in this Plan.

The proposed location of the 4 Chalets will result in them being subject to BAL-12.5. As such they are located appropriately but the required separation distances from the classified vegetation will need to be maintained. These distances are stated in the next section of this Plan, Section 7.3 ‘Vegetation Management’.
7.3 Vegetation Management

Ongoing Maintenance of Assessed Vegetation

1. Where any existing or planned re-vegetation has been assessed as “low threat” (meeting AS 3959-2009 Section 2.2.3.2 requirements) and excluded from classification then this area will be managed to continue to meet those requirements (refer to Appendix 3) and enable the buildings to retain their determined BAL ratings;

2. Any classified vegetation onsite (i.e. within a subject lot) that has directly contributed to the determined BAL rating for a given building, will be managed such as to not change that vegetation to a higher risk classification; and

3. Where a local government issues an annual firebreak notice under s33 of the Bush Fires Act 1954, this will be complied with.

Bushfire Protection Zones

The Guidelines for Planning in Bushfire Prone Areas (WAPC 2015) set out the requirements to create an Asset Protection Zone (APZ) and a Hazard Separation Zone (HSZ). The aim of these bushfire protection zones is to have a fire of diminishing intensity and flame length as it approaches development. These reduced fuel loads will reduce the intensity of radiant heat onto the buildings, thereby increasing their survivability. This will also be important for firefighter and occupant’s safety during fire suppression activities.

Asset Protection Zone (APZ) – This is to be established, within a subject lot’s boundary such that a building will not be subject to a BAL rating greater than BAL-29. On a lot size where it is possible to achieve, it is to be a minimum width of 20 metres and increased when directed to the width required such that such that a building will not be subject to a BAL rating greater than BAL-29.

The APZ must be maintained as either a non-vegetated area or as low threat vegetation managed in a minimal fuel condition as per AS 3959-2009 s2.2.3.2 (e) and (f). A minimal fuel condition is stated in the standard as meaning “there is insufficient fuel available to significantly increase the severity of the bushfire attack” and being “recognisable as short cropped grass for example to a nominal height of 100mm.”

Hazard Separation Zone (HSZ) - Where the lot size permits, a Hazard Separation Zone (HSZ) should also be established.

Refer to Appendix 3 and Appendix 4 specific technical requirements.
Establishing the APZ

An Asset Protection Zone (APZ) creating a low fuel area will be required to be incorporated into the landscaping surrounding current and any future buildings on the lot.

During the development construction groundworks, vegetation will be removed from the development site. If any area of existing vegetation is retained, it must be modified to the extent that it can be excluded from classification and maintained in a minimal fuel condition (refer to Appendix 3) and meet the specifications of an Asset Protection Zone (APZ).

Minimum Vegetation Separation Distances

To retain the stated BAL rating of BAL-12.5 the separation distances from the classified vegetation to the proposed chalets will need to be maintained to at least the minimum distances shown in Table 7.3.1.

This minimum separation distance from any classified vegetation, that corresponds to the proposed building’s assessed BAL will be maintained as either a non-vegetated area or as low threat vegetation managed in a minimal fuel condition as per AS 3959-2009 s2.2.3.2 (e) and (f). A minimal fuel condition is stated in the standard as meaning “there is insufficient fuel available to significantly increase the severity of the bushfire attack” and being “recognisable as short cropped grass for example to a nominal height of 100mm.” Refer to Appendix 3 of this Plan for further detail.

It is also recognised that the local government issues an annual firebreak notice under s33 of the Bushfires Act 1954 and this will be complied with.

Ongoing Maintenance of Classified and Excluded Vegetation

Table 7.3.1: Ongoing maintenance of the separation area from any future building works to the classified vegetation (refer to Figure 5.1 for vegetation area details)

<table>
<thead>
<tr>
<th>Vegetation Area</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>

</thead>
<tbody>
<tr>
<td>Proposed Chalet 1-4 with Determined BAL of BAL-12.5</td>
<td>29</td>
<td>17</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note that the classified vegetation associated with the BAL ratings indicated in Table 7.3.1, is primarily vegetation that is offsite (i.e. outside a subject lot). This offsite vegetation has been assessed as it would exist in its mature and unmanaged state. It is a bushfire threat that the owner of the subject land (of this Proposal) has no control over but the level of bushfire threat will not increase above that assessed in this Plan.
7.4 Vehicular Access – Element 3 of the Bushfire Protection Criteria

The internal layout, design and construction of public and private vehicular access and egress in the development must allow emergency and other vehicles to move through it safely at all times and specifically during a bushfire event.

It is the developer’s responsibility to ensure that subdivision and development design allow for the bushfire protection criteria for vehicular access be met as per the ‘Guidelines’. How this Proposal complies with the bushfire protection criteria is set out in s7.1 with additional information and justification presented below if necessary.

Gingin Brook Road provides access and egress to two different destinations. As a sealed public road it is available to all residents and the public at all times and under all weather conditions.

The private driveway from Gingin Brook road to the existing onsite Managers residence is >50m in length and will be developed to the appropriate standard of the Guidelines as shown in Appendix 5 with the appropriate width, and turnaround around areas suitable for a 3.4 fire appliance.

An Emergency Access Way will be developed from the proposed development in a southerly direction to Harriss Road. The Emergency Access Way is to be designed and maintained to the Guidelines for Planning in Bushfire Prone Areas December 2015. The Emergency Access Way will provide for alternate access/egress to/from the site in the event of a bushfire emergency.

Note: The Emergency Access Way crossing over the winter creek will use the existing 2.4-metre-wide culvert to minimise environmental damage to the riparian zone.

7.5 Firefighting Water Supply

The intent is to ensure water is available to the subdivision, development or land use to enable people, property and infrastructure to be defended from bushfire. This intent may be achieved where the subdivision, development or land use is provided with a permanent and secure supply that is sufficient for firefighting purposes.

The required water tanks, couplings and access will be installed as per the technical requirements detailed in Appendix 6.
7.6 Building Construction Standards

7.6.1 Future Habitable Buildings on the Subject Site

Any proposed residential building work (Class 1, 2, 3 and associated Class 10a buildings and decks) subject to a BAL rating above BAL-Low will be required to be constructed to the requirements corresponding to their determined BAL as set out in AS 3959-2009 Construction of buildings in bushfire prone areas or the (NASH) Standard – Steel Framed Construction in Bushfire Prone Areas (for Class 1a and 1b buildings only).

The exception will be if higher construction standards are to apply due to a local government requirement or as a part of an alternative solution that might be presented in this Plan to enable compliance with the Bushfire Protection Criteria.

Only residential buildings Class 1, 2 or 3 and associated Class 10a buildings and decks are required by the BCA to be constructed to the bushfire standards set out in AS3959-2009 and as determined by their BAL rating. This standard is not applicable to Class 4 – Class 9 buildings unless imposed by the relevant local government (or voluntarily adopted).

However, determining the BAL ratings of proposed Class 4-9 buildings allows for them to be:

- Sited appropriately and have classified vegetation removed and/or managed such that their exposure to flames, radiant heat and embers is as low as is practically possible.
- Constructed to the standard corresponding to the BAL rating if the developer, owner or local government deem it is prudent and necessary.

Bushfire Prone Planning Recommendation: When the subject site is in a designated bushfire prone area and the determined BAL is BAL-LOW, Bushfire Prone Planning considers a building in this situation to still be at some risk of an ember attack. Therefore, to improve the protection for occupants as well as the building itself, we recommend that consideration be given to constructing the proposed building works to the standard corresponding to a BAL of BAL-12.5.

This Plan has provided determined BAL’s because the future building works actual location is known.

7.6.2 Existing Habitable Buildings on the Subject Site

Class 1, 2 and 3 buildings and Class 10a associated buildings and decks, constructed prior to the requirement to comply with bushfire performance requirements, do not need to meet these requirements.
Buildings of Class 4 to Class 9 are not required by the Building Code of Australia (BCA) to be constructed to comply with bushfire performance requirements.

The Guidelines for Planning in Bushfire Prone Areas (WAPC 2015) state, “The policy measures of SPP 3.7 and these Guidelines are not to be applied retrospectively” (Guidelines s2.2). Further, the WA Building Commission ‘Building in Bushfire Prone Areas’ information note states “Building standards and regulations are generally not retrospective”.

Therefore, retrospectively upgrading a building to comply with the bushfire performance requirements can only be a recommendation.

**Bushfire Prone Planning Recommendation:** As the existing buildings exist in a bushfire prone area and may be subject to a bushfire attack, Bushfire Prone Planning recommended that some degree of upgrading be considered in order to improve the protection for occupants and the building’s survivability. At a minimum protection from ember attack should be considered (i.e. constructed to the standard required for BAL-12.5).

Certain existing buildings were identified in Section 5.2.1 ‘Existing Buildings on Subject Site – BAL Ratings’ as having BAL ratings of BAL 12.5. To lower the potential exposure of these buildings to the effects of flames, radiant heat and embers, the separation distance between the existing building works and the relevant classified vegetation can be increased. This can be achieved with the appropriate combination of onsite vegetation removal. The recommended ‘Conditional’ BAL is BAL-12.5 as this is achievable and appropriate. The required separation distances of building from classified vegetation are set out in Table 7.6.1. Note that local government approval is likely to be required prior to removal of any significant native vegetation. It is recommended that these existing buildings should be modified to comply with the construction standards corresponding to BAL-12.5 as a minimum. The primary intention of constructing to this standard is to reduce the impact of an ember attack. This may require retrofitting of certain components.
Table 7.6.1: Existing buildings on site – required minimum separation distance to achieve the stated BAL rating.

<table>
<thead>
<tr>
<th>All Existing Buildings</th>
<th>Classified Vegetation Area</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Recommended BAL</strong></td>
<td>BAL-12.5</td>
</tr>
<tr>
<td>Minimum required separation distance (m)</td>
<td>29</td>
</tr>
</tbody>
</table>

**Important:**

1. The area of land representing the above minimum separation distance must be maintained as either a non-vegetated area or as low threat vegetation managed to a minimal fuel condition (i.e. insufficient fuel available to significantly increase the severity of the bushfire attack e.g. short cropped grass to nominal height of 100mm) as per AS 3959-2009 s2.2.3.2. Refer to Appendix 3.
2. It is the responsibility of the landowner to maintain the bushfire protection measures on their property. This includes the vegetation separation distance, the asset protection zone and hazard separation zone (for specifications refer to Appendix 4) and compliance with the local government’s annual firebreak notice issued under s33 of the Bush Fires Act 1954.
8 Specific Land Uses

State Planning Policy 3.7 Planning in Bushfire Prone Areas (Department of Planning and WAPC 2015) sets out in policy measure 6.6 what is required for ‘vulnerable’ or ‘high risk’ land uses to be supported in bushfire prone areas subject to BAL-12.5 or higher.

8.1 Vulnerable Land-Use – Definition / Application / Requirements

</table>

Information reference: SPP 3.7 Planning in Bushfire Prone Areas (Department of Planning and WAPC 2015 s6.6 and s7) and the Guidelines for Planning in Bushfire Prone Areas (WAPC 2015 s5.5):

Definition and Application

SPP 3.7 defines vulnerable land use as a land use where persons may be less able to respond in a bushfire emergency. The ‘Guidelines expand this and state that vulnerable uses of land are typically those that are considered to have occupants with a lesser capacity to respond in the event of a bushfire and that may present evacuation challenges.

The intent of the policy measure “is to recognise that such sites require special consideration when located in bushfire prone areas. This will ensure that bushfire risk management is sufficiently addressed in the planning assessment of these land uses”.

Examples of ‘vulnerable’ land uses include (but are not limited to) hospitals, nursing homes and retirement villages, tourist accommodation including camping grounds and ecotourism, childcare centres, educational establishments, places of worship and corrective institutions. The definition may also encompass places of assembly, retail and office premises, as well as subsidiary uses of residential development, such as family day care centres or home businesses, and essential infrastructure such as energy, transport, telecommunications and other utilities.
In general terms the following scenarios might need to be considered as vulnerable land uses:
   a. Where persons are present that have a lesser physical/mental capacity to respond to emergencies;
   b. Where occupancy might be transient in nature;
   c. Where greater numbers of persons may be present at certain times;
   d. Where occupants are typically not fully familiar with the building or area.

Required Information

1. In areas where BAL-12.5 to BAL-29 applies, a subdivision or development application will not be supported unless it is accompanied by a Bushfire Management Plan (BMP) jointly endorsed by the relevant local government and the State authority for emergency services;
2. The BMP is to include an assessment against the bushfire protection criteria requirements demonstrating compliance within the boundary of the development site.
3. Subdivision applications are to make provision for emergency evacuation;
4. Development applications should include a bushfire evacuation plan for proposed occupants; and
5. Where BAL-40 or BAL-FZ applies, applications will not be supported unless they meet the definition of ‘minor’ or ‘unavoidable’ development.

As part of the Proposal it is recognised that an emergency evacuation plan for occupants is required to be created.
9 Compliance Statements - of the Proposal and this Plan

This section of the Plan makes statements with respect to the Proposal’s compliance against the components of the WA framework for bushfire risk management. It also states how the content of this BMP satisfies the requirements of SPP 3.7.

The key components of the WA framework for bushfire risk management are summarised in Appendix 1.

9.1 State Planning Policy No. 3.7: Planning in Bushfire Prone Areas

<table>
<thead>
<tr>
<th>SPP 3.7 Policy Objectives - Proposal Compliance Statement</th>
<th>The Proposal Meets Objectives</th>
</tr>
</thead>
<tbody>
<tr>
<td>s5.1 Avoid any increase in the threat of bushfire to people property and infrastructure</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Implementation of the bushfire risk management measures as set out in this Plan, including meeting the requirements of the bushfire protection criteria; will avoid any increase in the threat of bushfire.

s5.2 Identify and consider bushfire risks in decision-making at all stages of the planning and development process (to reduce vulnerability to bushfire). Yes

The bushfire risks have been identified and assessed, as relevant for the stage of this planning submission, using the tools prescribed in SPP 3.7 (and the associated document Guidelines for Planning in Bushfire Prone Areas WAPC 2015). Refer to Section 5 ‘Assessment of Bushfire Risk’.

s5.3 Ensure that all stages of planning submissions take into account bushfire protection requirements and include specified bushfire protection methods. Yes

The bushfire protection requirements and any specified protection methods, relevant for the stage of this planning submission, have been taken into account and presented in Section 7 ‘Bushfire Risk Management Measures’.

s5.4 Achieve an appropriate balance between bushfire risk management measures; biodiversity conservation values; environmental protection and biodiversity management; and landscape amenity, with consideration of climate change. Yes

The components of this objective have been considered along with the requirements set out in the ‘Guidelines’ s2.3. Identifying and addressing issues relevant for the stage of this planning submission is presented in this Plan in Section 6 ‘Environmental Considerations’.
## SPP 3.7 Policy Measures – BMP Compliance Statement

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
<th>BMP Compliance</th>
</tr>
</thead>
<tbody>
<tr>
<td>s6.1</td>
<td>Higher order strategic planning documents in bushfire prone areas</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The requirements stated in SPP 3.7 s6.3 include provision of high level consideration of relevant bushfire hazards when identifying or investigating land for future development.

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
<th>BMP Compliance</th>
</tr>
</thead>
<tbody>
<tr>
<td>s6.2</td>
<td>Strategic planning proposals, subdivision and development applications</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Plans relating to land that has or will have a BHL above low and/or where a BAL rating above BAL-Low apply, are to comply with these policy measures. If the proposal has or will on completion have a moderate BHL and/or where BAL-12.5 to BAL-29 applies, it may be considered for approval when the required information is provided and it can be undertaken in accordance with policy measures 6.3, 6.4 or 6.5.

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
<th>BMP Compliance</th>
</tr>
</thead>
<tbody>
<tr>
<td>s6.3</td>
<td>Information to accompany strategic planning proposals</td>

<tbody>
<tr>
<td>s6.5</td>
<td>Information to accompany development applications</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The requirements stated in SPP 3.7 s6.5 include provision of a BAL contour map (or BAL assessment), identify issues arising from the contour map (or BAL assessment) and an assessment against the bushfire protection criteria. Refer to Section 5 of this Plan.

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
<th>BMP Compliance</th>
</tr>
</thead>
<tbody>
<tr>
<td>s6.6</td>
<td>Vulnerable or high risk land uses (subdivision and development applications).</td>
<td>Yes</td>
</tr>
</tbody>
</table>

In areas where BAL-12.5 to BAL-29 applies, subdivision applications should make provision for emergency evacuation (presented in this Section 7 of this Plan). Development applications should include an emergency evacuation plan for proposed occupants and/or a risk management plan for any flammable on-site hazards (presented as a separate document). In areas where BAL-40 or BAL-FZ applies, development applications will additionally require statements against the items of SPP 3.7 s6.7.1 and s6.7.2 (included in Section 7 of this Plan).
### SPP 3.7 Policy Measures – BMP Compliance Statement

<table>

<td>Yes</td>
</tr>
<tr>
<td>s6.9</td>
<td>Advice of State/relevant agencies/authorities for environmental protection to be sought</td>
<td>N/A</td>
</tr>
</tbody>
</table>

For all stages of planning proposals, advice from relevant authorities has been sought, considered and is referenced in Section 7 of this Plan where:

- compliance with SPP 3.7 policy measures is unlikely to be achieved;
- additional/alternative measures are proposed; and/or
- this application contains unavoidable development or vulnerable or high-risk land uses

For all stages of planning proposals, advice from relevant authorities has been sought, considered and is referenced in Section 6 of this Plan where:

- The clearing of vegetation within protected environmentally sensitive areas is proposed
- Substantial clearing of native vegetation is proposed
- Development abuts land managed by a State or Federal authority

9.2 Guidelines for Planning in Bushfire Prone Areas (WAPC 2015 as amended)

The ‘Guidelines’ are designed to assist in the interpretation of SPP3.7’s objectives and policy measures. As such they have been referenced and complied with in compiling this Bushfire Management Plan which is to accompany the planning submission. This Plan contains, as a minimum, the information required as per the ‘Guidelines’ checklist.

9.3 Bushfire Protection Criteria (WAPC 2015 ‘Guidelines’)

The proposed land use has been assessed against the bushfire protection criteria. The assessment of the bushfire risk management measures (i.e. those relevant to each element) and the demonstration of how the proposal meets the criteria are presented in Section 7.1 of this Plan - ‘Bushfire Protection Criteria - Assess and Demonstrate Compliance’.

Where the proposal has not been able to fully meet an acceptable solution for a given element or an alternative solution is proposed, then the appropriate sub section of Section 7 ‘Bushfire Risk Management Measures’, demonstrates how the Proposal will comply with the performance principle and the intent of that element. Any required advice and recommendations from DFES and other referral authorities will be included.

9.4 Local Variations to Bushfire Protection Criteria

<table>
<thead>
<tr>
<th>Question</th>
<th>Answer</th>

</thead>
<tbody>
<tr>
<td>Are there any endorsed local variations to the bushfire protection criteria (e.g. through a local planning policy) that are to apply to the proposed land use and therefore addressed in Section 7 ‘Bushfire Risk Management Measures’ of this Plan?</td>
<td>No</td>
</tr>
<tr>
<td>Does the proposal satisfy the local variations to the bushfire protection criteria?</td>
<td>N/A</td>
</tr>
</tbody>
</table>

9.5 WA Building Act 2011

Relevant regulations associated with the Act are the Building Regulations 2012 and the Building Amendment Regulations (No 3) 2015. The legislation adopts the Building Code of Australia as the minimum technical requirement for the design and construction of buildings and certain other structures in WA and prescribes applicable building standards for certain classes of buildings located in areas designated by the Fire and Emergency Services Commissioner as bushfire prone areas (identified on the Map of Bushfire Prone Areas).
Is this land use proposal at a planning stage at which lot layout is known and construction of buildings (any class) is being proposed? | Yes

If the response is ‘No’, then this Proposal is at a planning stage where specific compliance with the Building Act 2011 is not required – rather it will apply at future planning stages. However, if a BAL Contour Map and/or BAL assessment has been provided as part of this Plan, they can apply and may be able to be used for any future planning application (at the applicable planning stage involving construction of buildings).

If the response is ‘Yes’, then one of the situations below will apply to this proposal.

<table>
<thead>
<tr>
<th>The Nature of this Land Use Proposal</th>
<th>Applicable</th>
</tr>
</thead>
<tbody>
<tr>
<td>A proposal for a single house or ancillary dwelling (Class 1); or a specified building located in a bushfire prone area on a lot less than 1100m² or on a lot equal to or greater than 1100m² but subject to a BAL of BAL-29 or less, does not need to lodge a development application (but will require a building permit application). However, the relevant local government can additionally require that a development application is submitted for planning approval. Bushfire construction requirements will apply in both cases.</td>
<td>No</td>
</tr>
<tr>
<td>A proposal for a single house or ancillary dwelling (i.e. Class 1); or a specified building located in a bushfire prone area on a lot equal to or greater than 1100m² but subject to BAL-40 or BAL-FZ must lodge a development application and bushfire construction requirements will apply.</td>
<td>No</td>
</tr>
<tr>
<td>A proposal, regardless of lot size, for a habitable building other than a single house or ancillary dwelling (i.e. Class 2 or 3 residential or accommodation buildings); or a specified building, located in a bushfire prone area, must lodge a development application and bushfire construction requirements will apply.</td>
<td>Yes</td>
</tr>
<tr>
<td>A proposal, regardless of lot size, for mixed use, commercial, industrial buildings or public facilities (i.e. Class 4-9 buildings), located in a bushfire prone area, and must lodge a development application. Bushfire construction requirements will not apply (unless the local government additionally requires them to apply).</td>
<td>Yes</td>
</tr>
</tbody>
</table>

This Proposal complies with the WA Building Act 2011 and associated regulations by creating a BAL Contour Map (refer Section 5 of this Plan ‘Assessment of Bushfire Risk’) and noting any obligation for future buildings to be constructed to the standard corresponding to the determined bushfire attack levels in Section 10 of this Plan ‘Responsibilities for Implementation and Maintenance’.
9.6 AS 3959 Construction of Buildings in Bushfire Prone Areas (2009 as amended)

This Proposal complies with the methodology set out in AS 3959 to classify vegetation that is a bushfire threat and to calculate the bushfire attack levels presented as a BAL Contour Map and/or a BAL assessment in Section 5 of this Plan ‘Assessment of Bushfire Risk’.

For the construction of any Class 1, 2, 3 buildings and associated Class 10a buildings and decks, this land use proposal will comply with the construction requirements, set out in AS 3959, that correspond to the determined bushfire attack level/s for the subject site. This obligation is stated in Section 9 of this Plan ‘Responsibilities for Implementation and Maintenance’.

9.7 Local Government Firebreak Notice

This Proposal complies with the requirements of the relevant local government notice by stating the landowner’s obligations in Section 10 of this Plan ‘Responsibilities for Implementation and Maintenance.’ Additionally, the obligation is noted in Section 7.3 ‘Vegetation Management’.

9.8 Other Applicable Local Government Documents

This Plan provides the required information such that this Proposal can comply with the requirements of:

- The Local Planning Scheme provisions with respect to bushfire risk management
10 Responsibilities for Implementation & Maintenance

This section sets out the responsibilities of landowners/proponents (including future landowners), builders and local government in relation to the implementation and maintenance of the requirements of SPP 3.7 and the ‘Guidelines’.

10.1 Landowner / Proponent Responsibilities (and those acting on their behalf)

Implementation

• Ensure anyone listed as having responsibility under the Plan has endorsed it and is provided with a copy for their information. This includes the landowners/proponents, local government and any other authorities or referral agencies (‘Guidelines’ s4.6.3).

• To confirm the indicative BAL ratings identified on the BAL Contour Map are still accurate after development works have been completed, a compliance certificate or report will be required to be submitted. (WAPC Factsheet ‘BAL Contour Maps’).

• Construction of emergency access ways and associated signs and gates must comply with the standards (Appendix 5 ‘Vehicular Access’).

• Construction of private driveways must comply with the standards (Appendix 5 ‘Vehicular Access’).

• For a non-reticulated water supply, ensure that the emergency water supply structure for firefighting purposes (tanks, couplings and access) is constructed to comply with the standards (s7.5 ‘Fire Fighting Water Supply’ and Appendix 6 ‘Water’) or to the standard set out by the relevant local government.

• A procedure must be in place to ensure that the emergency water supply tanks are maintained at or above designated capacity at all times (‘Guidelines Appendix 4 ‘Bushfire Protection Criteria’).

• Implement the low fuel Asset Protection Zone (APZ) and where applicable the Hazard Separation Zone (HSZ) as per s7.3 ‘Vegetation Management’ and Appendix 4 ‘APZ and HSZ’.
• Ensure all future buildings the landowner/proponent has responsibility for, are designed and constructed in full compliance with the requirements of the WA Building Act 2011 and the referenced Building Code of Australia (BCA), and with any identified additional requirements of the relevant local government. This should include due consideration of constructing any Class 4-9 buildings to the standard corresponding to their determined BAL even though not required by the BCA.

For any Class 1, 2, or 3 buildings and associated Class 10a buildings or decks this will include compliance with AS 3959-2009 *Construction of Buildings in Bushfire Prone Areas* (2009 as amended) and/or the National Association of Steel Housing – *(NASH)* Standard – *Steel Framed Construction in Bushfire Prone Areas*, whereby construction standards corresponding to the assessed BAL will be applied (Appendix 2 ‘Bushfire Risk Assessment – Methodology Explained’).

• There is an outstanding requirement, created by this bushfire management plan, that a bushfire evacuation plan that addresses the circumstance of bushfire will be required. This may form part of an overall emergency evacuation plan.

**Maintaining Compliance**

• Current and future landowners/proponents must continue to apply the bushfire management measures set out in this Plan. They must inform any builders (of future structures on a Lot) of the existence of the Plan and the responsibilities it contains.

• The landowner/proponent is responsible for the ongoing review and implementation of the Bushfire Management Plan to ensure that the bushfire risk management measures remain effective. Bushfire plans do not expire and should be seen as a ‘living document’. They may require updating in certain circumstances, including (but not limited to) if site conditions change, if further details are required at subsequent stages of the planning process or to reflect new technologies or methodologies in best practice bushfire risk management *(‘Guidelines’ s4.6.4 and s4.6.5).*

• Respond to and comply with fire protection or hazard management notices issued by the local government. This includes compliance with the Shire of Gingin Firebreak Notice (the current requirements can be found on the Shire of Gingin Website), issued under s33 of the Bush Fires Act 1954 as directed by the *(‘Guidelines’ s6.1 and referenced in this Plan s7.3 ‘Vegetation Management’, s10.3 ‘Local Government Firebreak Notice’ and Appendix 4 ‘APZ and HSZ’).*

• Maintain the low fuel Asset Protection Zone (APZ) within the Lot boundary and where applicable the Hazard Separation Zone (HSZ) as per s7.2 *(‘Vegetation Management’ and Appendix 4 ‘APZ and HSZ’).*
• The stated minimum separation distance (refer to s7.3 Table 7.3.1) from any classified vegetation, that corresponds to a particular lot’s assessed BAL, must be maintained as either a non-vegetated area or as low threat vegetation managed in a minimal fuel condition as per AS 3959-2009 s2.2.3.2 (e) and (f). A minimal fuel condition is stated in the standard as meaning “there is insufficient fuel available to significantly increase the severity of the bushfire attack” and being “recognisable as short cropped grass for example to a nominal height of 100mm.” Refer to Appendix 3 of this Plan for further detail.

• Where any existing or planned re-vegetation has been assessed as “low threat” (meeting AS 3959-2009 Section 2.2.3.2 requirements) and excluded from classification then this area will be managed to continue to meet those requirements and enable the buildings to retain their determined BAL ratings.

• Any classified vegetation that has directly contributed to the determined BAL rating for a given Lot or building, must be managed such as to not change that vegetation to a higher risk classification.

• For the emergency water supply tank/s that have been installed, be aware of the arrangement that is in place regarding who has the responsibility for maintaining the emergency water supply tank at or above designated capacity at all times. This could be in the form of an agreement with the local government and the fire service. Check that this is being complied with (refer to s7.5 ‘Fire Fighting Water Supplies’ and Appendix 6 ‘Water’).

10.2 Builder Responsibilities

The builder (generally named on the building permit) is responsible for ensuring that the building or incidental structure to which a building permit applies is, on completion, compliant with the Building Code of Australia (BCA).

For Classes 1a, 1b, 2, 3 and associated 10a buildings or decks located in a designated bushfire prone area, compliance with the BCA requires that these buildings are constructed to the requirements corresponding to their bushfire attack level rating.

The construction standards for Class 1a and 1b buildings are contained in:

• AS 3959 - 2009 Construction of buildings in bushfire prone areas; or
• National Association of Steel Housing – (NASH) Standard – Steel Framed Construction in Bushfire Prone Areas.

The construction standards for Classes 2, 3 and associated 10a buildings or decks are contained in:

• AS 3959 - 2009 Construction of buildings in bushfire prone areas.
The building/s must also comply with any additional local government requirements.

For any Class 4-9 buildings the builder must comply with any construction requirements that are additional to those contained in the BCA. Of particular issue is any requirement, made by the relevant local government or the owner, to construct to the standard corresponding to the determined BAL for proposed buildings.

10.3 Local Government Responsibilities

Implementation

- Provide advice where the clearing of locally significant vegetation is proposed.

- Register this Bushfire Management Plan and keep a record of the sites referred to for the purpose of identify servicing and infrastructure gaps. (‘Guidelines’ s4.6.4).

Maintaining Compliance

- Develop and maintain district bushfire fighting services and facilities.

- Monitor landowner compliance with the annual firebreak notice issued under s33 of the Bush Fires Act 1954.
Appendix 1
The WA Framework for Bushfire Risk Management

This section of the Bushfire Management Plan sets out the applicable legislation, regulations, policies, guidelines, documents, and associated bushfire risk assessments that a Bushfire Management Plan will need to reference and where applicable, comply with. Statements of compliance against these requirements, as required by the ‘Guidelines’, are presented in Section 8 of this Plan.

The state government of WA has committed to addressing bushfire through the implementation of a risk-based system of land-use planning and development that aims to reduce the risk of bushfire. The legislative means of facilitating this is through the Planning and Development Act 2005 and its interaction with the Fire and Emergency Services Act 1998 and the Building Act 2011.

Planning and Development (Local Planning Schemes) Amendment Regulations 2015

These regulations are given effect under the Planning and Development Act 2005. The Planning and Development (Local Planning Schemes) Regulations 2015 are amended to introduce ‘Schedule 2 Part 10A ‘Bushfire Risk Management’ which establishes the deemed provisions relating to bushfire risk management.

“The deemed provisions relating to bushfire risk management work with the State Planning Policy 3.7: Planning in Bushfire Prone Areas (SPP 3.7) and Guidelines for Planning in Bushfire Prone Areas (Guidelines); Map of Bushfire Prone Areas; Building Regulations 2012 and Building Code of Australia to guide planning and development proposals in bushfire prone areas to ensure bushfire risk is properly managed.

The deemed provisions provide a mechanism to require a development approval, and through this the application of SPP 3.7 and the Guidelines, to development on sites where BAL-40 or BAL-Flame Zone (FZ) applies. SPP 3.7 sets out the planning hierarchy and the information required at each stage of the planning process whilst the Guidelines provide information on how SPP 3.7 should be implemented” (source: WAPC Planning Bulletin 111/2015 Planning in Bushfire Prone Areas).

The deemed bushfire provisions:
- Only apply to development that is proposed on a site in a designated bushfire prone area.
- Override any existing local planning scheme provisions relating to bushfire, including any inconsistent provisions, apart from special control areas.
• Are in addition to any provisions relating to development in a bushfire prone area that apply to a special control area.
• Can be supplemented by a local planning scheme (by implementing a special control area) but not varied or exempted.
• Are applied and work through the following legislation, regulations, policies, guidelines, and documents – each of which this Bushfire Management Plan will address.

Map of Bushfire Prone Areas

The Map of Bushfire Prone Areas identifies land that has been designated as being bushfire prone by the Fire and Emergency Services Commissioner under the Fire and Emergency Services (Bushfire Prone Areas) Order 2015 as part of the Fire and Emergency Services Act 1998.

Designation as a bushfire prone area (highlighted as pink on the map) reflects the potential of bushfire to affect that site. It acts as a mechanism for initiating further assessment in the planning and building process. This can involve bushfire risk assessment and management measures being required in planning submissions and activation of the bushfire construction requirements of the Building Code of Australia.

State Planning Policy No. 3.7: Planning in Bushfire Prone Areas (SPP 3.7)

This policy is made under the Planning and Development Act 2005 and provides the foundation for land use planning to address bushfire risk management in Western Australia.

SPP 3.7 applies to every stage of the planning process (i.e. all higher order strategic planning documents; strategic planning proposals; subdivision and development applications) in designated bushfire prone areas. It also applies to an area not yet designated as bushfire prone but is proposed to be developed in a way that introduces a bushfire hazard (Guidelines for Planning in Bushfire Prone Areas WAPC 2015 s3.2.2).

The objectives of this policy are to:

• Ensure that all stages of land use planning (higher order strategic planning documents; strategic planning proposals; subdivision and development applications) identify and consider bushfire risk and apply specified bushfire protection measures; and
• To have an outcome that will avoid any increase in the threat of bushfire to people, property and infrastructure, preserve life and achieve an appropriate balance between bushfire risk management measures and all environmental conservation aspects.

Policy measures to achieve the objectives are defined and:

• They vary according to the type and scale of the planning proposal and stage of the development process;
• They set out the information to be prepared for each type of proposal; and
• They refer to the Guidelines for Planning in Bushfire Prone Areas (WAPC 2015) as supporting this policy and providing the procedural detail for assessment and presentation of the required information.

Guidelines for Planning in Bushfire Prone Areas (WAPC 2015 as amended)

These Guidelines are designed to supplement and assist in the interpretation of SPP3.7’s objectives and policy measures. They provide advice on how bushfire risk is to be addressed when planning, designing or assessing a planning proposal.

As an endorsed standard (by the Office of Bushfire Risk Management), these Guidelines, in conjunction with SPP 3.7, are the predominant documents in the State for use by decision making authorities and referral agencies, during the consideration of strategic planning proposals, subdivisions and development applications.

The Guidelines set out the interrelationships between, and requirements for, various assessment tools used to assess risk in the planning context, as prescribed by SPP 3.7. These include:

• A Bushfire Hazard Level assessment;
• A Bushfire Attack Level (BAL) Contour Map;
• A Bushfire Attack Level (BAL) assessment;
• The Bushfire Protection Criteria; and
• A Bushfire Management Plan

The ‘Guidelines’ reference the Bushfire Attack Level descriptions and assessment methodologies that are defined in AS 3959.
Bushfire Protection Criteria

The bushfire protection criteria (set out in the ‘Guidelines Appendix 4) are a performance based system of assessing bushfire risk management measures. An assessment against the criteria is to be undertaken for any strategic planning proposal, subdivision and development application for a site that has or will on completion, have a bushfire hazard level above ‘Low or a BAL rating above BAL-LOW.

The protection criteria consist of four elements: Location; Siting and Design of Development; Vehicular Access; and Water.

Each element has three components: Intent; Acceptable Solutions; and a Performance Principle. How to apply the Criteria is set out in the ‘Guidelines’ s4.5.2.

Local Variations to Bushfire Protection Criteria

Local governments may seek to add or to modify the acceptable solutions to recognise special local or regional circumstances (e.g. topography / vegetation / climate which reinforce the intent of a particular bushfire protection element and apply across a defined locality.

These endorsed (by WAPC and DFES) variations will be in the form of a local planning scheme amendment /provision or special control area. Currently they may be in the form of a local planning policy.

WA Building Regulations 2012

- These regulations exist under the WA Building Act 2011 and adopt the Building Code of Australia as the minimum technical requirements for the design and construction of buildings and certain other structures in WA.
- The majority of development in WA requires a building permit before construction can commence. This process typically occurs after the planning process.
- The Regulations include the Building Amendment Regulations (No.3) 2015 that prescribe applicable building standards for buildings located in areas designated by the Fire and Emergency Services Commissioner as bushfire prone areas (identified on the Map of Bushfire Prone Areas).

Building Code of Australia (BCA)

- The BCA provides minimum technical requirements for the construction of buildings. These are presented as Volumes One and Two of the National Construction Code series.
• The BCA requires an assessment of the potential intensity of bushfire attack for specific classes of residential buildings located in designated bushfire prone areas (Classes 1a, 1b, 2, 3 and associated 10a buildings or decks).

• The BCA requires that these buildings are constructed to the requirements corresponding to their bushfire attack level rating.

• Compliance with BCA bushfire requirements for Class 1a and 1b buildings in designated bushfire prone areas can be demonstrated by compliance with:
  a. Australian Standard AS 3959 Construction of buildings in bushfire prone areas; or

• Compliance with BCA bushfire requirements for Classes 2, 3 and associated 10a buildings or decks in designated bushfire prone areas can be demonstrated by compliance with:

AS 3959 Construction of Buildings in Bushfire Prone Areas (2009 as amended)

The objective of this Standard is to prescribe particular construction details for buildings to reduce the risk of ignition from a bushfire, appropriate to the:

a) Potential for ignition caused by burning embers, radiant heat or flame generated by a bushfire; and
b) Intensity of the bushfire attack on the building

To achieve this, the Standard defines six categories of Bushfire Attack Level (BAL), details their assessment methodology and specifies constructions standards corresponding to each.

Western Australia Bush Fires Act 1954 (as amended)

‘An Act to make better provision for diminishing the dangers resulting from bush fires, for the prevention, control and extinguishment of bush fires’. Matters addressed in the Act include prohibited burning times, total fire bans, bushfire control and extinguishment

The Act sets out the authority given to local government which enables them to:

• Control and extinguish bushfires
• Establish and maintain Bushfire Brigades
• Require landowners and/or occupiers to install and maintain firebreaks to their required specifications
• Require landowners and/or occupiers manage bushfire fuel loads upon the land to their required specifications

The applicable document is the annually issued Firebreak Notice published by the relevant local government that sets out the obligations for landowners and/or occupiers.
Other Applicable Local Government Documents

These may include:

- Local planning scheme provisions.
- Local planning strategy references to bushfire risk management.
- Local planning strategy references to environment.
- Applicable structure plans
- Special control area provisions
- Previous planning approvals

Other Documents

These may include:

- Any existing Bushfire Management Plan, Bushfire Hazard Level assessment or BAL assessment prepared over the site.
- Relevant landscaping plans applicable to the subject site.
Appendix 2
Bushfire Risk Assessment – Understanding the Methodology

In SPP 3.7 ‘bushfire risk’ is defined as “the chance of a bushfire igniting, spreading and causing damage to people, property and infrastructure.”

“Before a strategic planning proposal, subdivision or development application can be considered, it is necessary to understand the extent of the bushfire hazard and its potential to affect people, property and infrastructure. An assessment of bushfire risk is a key component of deciding whether a strategic planning proposal, subdivision or development application should be approved in an area with a potential bushfire threat (from the ‘Guidelines’).”

Policy measures in SPP 3.7 (and the associated document Guidelines for Planning in Bushfire Prone Areas WAPC 2015) prescribe the various assessment tools to be used to assess bushfire risk in the planning context. These are:

- Bushfire Hazard Level assessment;
- Bushfire Attack Level (BAL) Contour Map;
- Bushfire Attack Level (BAL) assessment;
- Bushfire protection criteria; and
- Bushfire Management Plan

The intent of this Appendix ‘Bushfire Risk Assessment – Understanding the Methodology’ is to provide an overview of the methodology used in assessing the Bushfire Hazard Level and the Bushfire Attack Level.

Bushfire Hazard Level Assessment Methodology

Used at a strategic planning level, this methodology rates bushfire hazards into three potential categories of low, moderate and extreme by considering the following characteristics:

- Vegetation types and areas
- Effective ground slope under the vegetation threat
- Existing land use on and around the area being assessed
- Prevailing climatic conditions when appropriate

These results are then presented as a Bushfire Hazard Level Map.
Bushfire Attack Level Assessment Methodology

The Australian Standard AS 3959-2009 Construction of Buildings in Bushfire Prone Areas defines a Bushfire Attack Level (BAL) as:

“A means of measuring the severity of a building’s potential exposure to ember attack, radiant heat and direct flame contact, using increments of radiant heat expressed in kilowatts per metre squared, and is the basis for establishing the requirements for construction to improve protection of building elements from attack by bushfire.”

AS 3959-2009 defines six categories of Bushfire Attack Level (BAL) (AS 3959 Appendix G); provides the assessment methodology (AS 3959 s2 and Appendix B); and specifies constructions standards corresponding to each BAL (AS 3959 s3 Table 3.1). The BAL’s and corresponding descriptions of the predicted levels of exposure and heat flux exposure thresholds are contained in the table on the following page.

AS 3959-2009 provides two methods to calculate Bushfire Attack Levels:

1. **Method 1** - a simplified procedure that involves five procedural steps to determine the BAL. It is subject to some limitations of the circumstances in which it can be used.
2. **Method 2** - a detailed procedure using calculations to determine BALs where a more specific result is sought or site conditions are outside the scope of Method 1. In particular, the use of Method 2 is to apply if the effective slope under the classified vegetation is greater than 20° down slope (and no more than 30° down slope) and the slope of the land between the site and the classified vegetation is no more than 20° regardless of slope type.

**Method 1 – Summarised Procedure**

- Determination of the area to be assessed
- Determine predominant vegetation type(s) within 100 metres of the site and classify
- Determination of distance of the site, building or building envelop from the classified vegetation type(s)
- Determination of the effective slope under the classified vegetation type(s)
- Determination of BAL’s - Forest Fire Danger Index (FFDI) of 80 is used for WA

**Separation Distance:** The distance from a subject site (or building) to a specific area of classified vegetation (i.e. the bushfire threat) is labelled in the tables of this Plan as a separation distance. This distance is measured to a point in the vegetation area represented by the “edge of the vegetation” as per AS 3959 -2009 s2.2.4 and the “base of the bushfire prone vegetation (not the canopy)” as per the BAL Assessment [Basic] Factsheet Version 1 December 2015 WAPC. The exact point of measurement is then decided by the assessor on the basis of the fuel structure and expected fire behaviour. If a precautionary approach is considered appropriate to a given situation the measurement will be taken at the canopy line.

</table>
Appendix 3
Vegetation Classification Exclusions (AS 3959-2009 s2.2.3.2)

Certain vegetation can be excluded from being classified in which case the Bushfire Attack Level shall be rated as BAL-LOW and no bushfire specific construction requirements apply. Such vegetation is one or a combination of the following:

a) Vegetation of any type that is more than 100m from the site.
b) Single areas of vegetation less than 1ha in area and not within 100m of other areas of vegetation being classified.
c) Multiple areas of vegetation less than 0.25ha in area and not within 20m of the site or each other.
d) Strips of vegetation less than 20m in width regardless of length and not within 20m of the site or each other, or other areas of vegetation being classified.
e) Non-vegetated areas, including waterways, roads, footpaths, buildings, and rocky outcrops.
f) Low threat vegetation, including grassland managed in a minimal fuel condition (i.e. insufficient fuel available to significantly increase the severity of a bushfire attack – recognisable as short cropped grass to a nominal height of 100mm for example), maintained lawns, golf courses, maintained public reserves and parklands, vineyards, orchards, cultivated gardens, commercial nurseries, nature strips and windbreaks.
Appendix 4
Technical Requirements – Bushfire Protection Criteria (APZ & HSZ)

A vital and effective component of managing the potential bushfire risk to people, property and infrastructure is creating bushfire protection zones in which fire fuel loads are reduced and maintained. They are an integral part of subdivision and development design and appropriately designed will greatly assist with bushfire prevention and suppression operations.

The Guidelines for Planning in Bushfire Prone Areas (WAPC 2015, Appendix 4) set out the requirements to create an Asset Protection Zone (APZ) and a Hazard Separation Zone (HSZ). The aim of these bushfire protection zones is to have a fire of diminishing intensity and flame length as it approaches development. These reduced fuel loads will reduce the intensity of radiant heat onto the buildings, thereby increasing their survivability.

The APZ is a low fuel area immediately surrounding a habitable or specified building and is designed to prevent direct flame contact with buildings and it improves safety for firefighters and occupants during fire suppression activities. Maintaining this zone in a minimal fuel condition is essential and firefighters are not obliged to protect an asset if they think the separation distance between the dwelling and vegetation is unsafe.

Note that individual local governments may vary their specifications of the APZ from those indicated below. These specifications will be contained in their Firebreak and Fuel load notices and are to be complied with.

Asset Protection Zone (APZ) Requirements (source: ‘WAPC Guidelines’)

- **Width:** 20 metres measured from any external wall of the building or building envelope. Where the slope increases above $10^\circ$, the APZ should be increased to ensure the potential radiant heat impact of a fire does not exceed 29 kW/m$^2$ (i.e. a BAL-29 rating on the building).
- **Location:** the APZ should be accommodated within the boundaries of the lot on which the building is situated. Where a full 20 metre APZ is not possible the APZ should be sufficient enough to ensure the potential radiant heat impact of a fire does not exceed 29 kW/m$^2$ (i.e. a BAL-29 rating on the building).
- **Fine Fuel Load:** reduced to and maintained at 2 t/ha. (DFES guidance-keep grasses short, remove leaves, twigs, dead material within shrubs and trailing bark, and prune branches to 2 metres above the ground).
- **Trees:** crowns are a minimum distance of 10 metres apart (a small group of trees within close proximity to one another may be treated as one crown provided the combined crowns do not exceed the area of a large or mature crown size for that species) and no crowns overhang the building.
- **Shrubs/Trees:** no tall shrubs or tree foliage within two metres of a building
- **Sheds and Fences:** within the APZ are constructed using non-combustible materials (e.g. iron, brick, limestone, metal post and wire) and sheds do not contain flammable materials.
Additional DFES Guidance

a) Do not clump shrubs close to a building. Ensure there is a gap between shrubs and buildings of three times their mature height.
b) Store firewood at least 20 metres away from the building.
c) Keep gutters free of leaves and other combustible material.
d) Roof mounted evaporative coolers to be fitted with ember screens.
e) Gas cylinders to vent away from a building and be tethered to prevent falling over.
f) Driveways and access ways must allow for safe passage of a fire appliance to all buildings on the land.
g) Land owners/occupiers must maintain compliance with the local government’s annual firebreak notice issued under s33 of the Bush Fires Act 1954.
h) Barriers such as driveways, lawns, ovals, orchards and pathways surrounding dwellings can form part of a APZ. Locate them to maximise building protection.

Hazard Separation Zone (HSZ) Requirements (source: ‘WAPC Guidelines’)

The ‘Guidelines’ set out the requirement for a physical separation between extreme bushfire hazard areas and development in low and moderate hazard areas both around and within subdivisions.

- **Width**: a minimum of 80 metres measured from the outer edge of the APZ for any vegetation classified in AS3959 as forest, woodland, closed shrub, open shrub, mallee/mulga and rainforest OR 30 metres, measured from the outer edge of the APZ, for unmanaged grassland.
- **Location**: within the boundaries of the lot on which the building is situated or, where this is not possible or desirable, within the boundaries of the development precinct in which the building is proposed to be located.
- **Fine Fuel Load**: dead material <6mm diameter and live material <3mm is to be reduced to and maintained at 5 - 8 t/ha for jarrah/marri dominated forest and woodlands, below 12 -15 t/ha in mallee heath and below 15 t/ha in karri forest.
- **Exception** - a HSZ may not be required if the proposed construction meets the standard appropriate to the assessed BAL for that location/building and that BAL does not exceed BAL-29.

The intent is to create a combined minimum separation distance of 100 metres between the buildings and the hazard (50 metres if unmanaged grassland). This separation distance may be reduced if the development is compliant with AS 3959 (i.e. as the distance from classified vegetation is reduced, the construction standard must be increased) or by using a performance principle assessment.
Appendix 5
Technical Requirements - Bushfire Protection Criteria (Vehicular Access)

Vehicular Access – Technical Requirements of Acceptable Solutions - Part 1
Source: Guidelines for Planning in Bushfire Prone Areas WAPC 2015

Acceptable Solution 3.3 Cul-de-sacs (including a dead-end road)
Their use in bushfire prone areas should be avoided. Where no alternative exists then the following requirements are to be achieved:

- Maximum length is 200m. If public emergency access is provided between cul-de-sac heads (as a right of way or public access easement in gross), the maximum length can be increased to 600m provided no more than 8 lots are serviced and the emergency access way is less than 600m in length;
- Turnaround area requirements, including a minimum 17.5m diameter head to allow type 3.4 fire appliances to turn around safely;
- The cul-de-sac connects to a public road that allows for travel in two directions; and
- Meet the additional design requirements set out in Part 2 of this appendix.

Acceptable Solution 3.4 Battle-axe
Their use in bushfire prone areas should be avoided. Where no alternative exists then the following requirements are to be achieved:

- Maximum length 600m and minimum width 6m; and
- Comply with minimum standards for private driveways.
Acceptable Solution 3.5 Private Driveways

The following requirements are to be achieved:

- The design requirements set out in Part 2 of this appendix; and

Where the house site is more than 50 metres from a public road:

- Passing bays every 200 metres with a minimum length of 20 metres and a minimum width of two metres (i.e., combined width of the passing bay and constructed private driveway to be a minimum six metres);
- Turn-around areas every 500 metres and within 50 metres of a house, designed to accommodate type 3.4 fire appliances to turn around safely (i.e., kerb to kerb 17.5 metres);
- Any bridges or culverts are able to support a minimum weight capacity of 15 tonnes; and
- All weather surface (i.e., compacted gravel, limestone or sealed).

Acceptable Solution 3.6 Emergency Access Way

An access way that does not provide through access to a public road is to be avoided bushfire prone areas. Where no alternative exists, an emergency access way is to be provided as an alternative link to a public road during emergencies. The following requirements are to be achieved:

- No further than 600 metres from a public road;
- Must be signposted including where they ajoin public roads;
- Provided as a right of way or public access easement in gross;
- Where gates are used they must not be locked and they must be a minimum width of 3.6 metres with design and construction approved by local government (refer to the example in this appendix); and
- Meet the additional design requirements set out in Part 2 of this appendix.
Acceptable Solution 3.7 Fire Service Access Routes (Perimeter Roads)
Are to be established to provide access within and around the edge of subdivision and related development and to provide direct access to bushfire prone areas for firefighters and link between public road networks for firefighting purposes. Fire service access is used during bushfire suppression activities but can also be used for fire prevention work. The following requirements are to be achieved:

- No further than 600 metres from a public road (driveways may be used as part of the designated fire service access);
- Dead end roads not permitted;
- Allow for two-way traffic (i.e. two 3.4 fire appliances);
- Provide turn-around areas designed to accommodate 3.4 fire appliances and to enable them to turn around safely every 500m (i.e. kerb to kerb 17.5 metres);
- All weather surface (i.e. compacted gravel, limestone or sealed) and have erosion control measures in place;
- Must be adequately sign posted;
- Where gates are used they must be a minimum width of 3.6 metres with design and construction approved by local government (refer to the example in this appendix) and may be locked (use a common key system);
- Meet the additional design requirements set out in Part 2 of this appendix;
- Provided as right of ways or public access easements in gross; and
- Management and access arrangements to be documented and in place.

A3.8 Firebreak Width
Lots greater than 0.5 hectares must have an internal perimeter firebreak of a minimum width of three meters or to the level as prescribed in the local firebreak notice issued by the local government.

* A six metre trafficable surface does not necessarily mean paving width. It could, for example, include four metres of paving and one metre of constructed road shoulders. In special circumstances, where 8 lots or less are being serviced, a public road with a minimum trafficable surface of four metres for a maximum distance of ninety metres may be provided subject to the approval of both the local government and DFES.
Gates and Signs

(example requirements – check with local government)

Gates (Bollards)

- Minimum width 3.6m
- Design and construction to be approved by relevant local government.
- Emergency access way gates must not be locked.
- Fire service access route gates may be locked but only with a common key that is available to local fire service personnel.
- Bollards will be to the relevant local government specifications

![Diagram of Gate and Bollards](image)
Signs

- Minimum height above ground of 0.9m.
- Lettering height to be 100mm.
- To display the words (as appropriate) “Emergency Access Only” or “Fire Service Access – No Public Access”.
- Design and construction to be approved by the relevant local government.
- Size 600mm x 400mm.
- Sign colour red, base (white) area is reflective background.
- Rounded corners, radius 20mm.
- White key-line 3mm wide, 3mm from outside edge.
- Suggested mounting hole six 6mm diameter.
Appendix 6
Technical Requirements - Bushfire Protection Criteria (Water)

Source: Guidelines for Planning in Bushfire Prone Areas WAPC 2015 and DFES website

**Acceptable Solution 4.1 Reticulated Areas**
The requirement is to supply a reticulated water supply, together with fire hydrants, in accordance with the specifications set by DFES and the relevant water supply authority (WA Water Corporation or Aqwest - Bunbury or Busselton Water). The Water Corporation’s ‘No 63 Water Reticulation Standard’ is deemed to be the baseline criteria for developments and should be applied unless local water supply authority’s conditions apply. Key specifications in the most recent version/revision of the design standard include:

- **Residential Standard** – hydrants are to be located so that the maximum distance between the hydrants shall be no more than 200 metres.

- **Commercial Standard** – hydrants are to be located with a maximum of 100 metre spacing in Industrial and Commercial areas.

- **Rural Residential Standard** – where minimum site areas per dwelling is 10,000 m² (1ha), hydrants are to be located with a maximum 400m spacing. If the area is further subdivided to land parcels less than 1ha, then the residential standard (200m) is to be applied.

![Figure A4.1: Hydrant Location and Identification Specifications](image)

Figure A4.1: Hydrant Location and Identification Specifications
Acceptable Solution 4.2 Non-Reticulated Areas

Static water supplies are used by firefighters in areas where there is no reticulated water supply. Water tanks are the only acceptable static water source acceptable to meet Element 4 (Water) of the Bushfire Protection Criteria as per the Guidelines for Planning in Bushfire Prone Areas (WAPC 2015) Appendix 4.

The requirements for the development being assessed can be increased by the relevant local government. If a variation applies it will be noted in s7.1 and s7.4.

<table>
<thead>
<tr>
<th>Volume:</th>
<th>50,000 litres per tank</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ratio of tanks to lots:</td>
<td>1 tank per 25 lots (or part thereof)</td>
</tr>
<tr>
<td>Location:</td>
<td>No more than two kilometres to the furthermost house site within the residential development to allow a 2.4 fire appliance to achieve a 20-minute turnaround time at legal road speeds.</td>
</tr>
<tr>
<td>Tank Construction:</td>
<td>Above ground tanks constructed using concrete or metal. Stands of raised tanks are constructed using non-combustible materials and heat shielding where applicable (required for metal stands).</td>
</tr>
<tr>
<td>Pipe Construction:</td>
<td>Galvanised or copper (PVC if buried 300mm below ground).</td>
</tr>
<tr>
<td>Access:</td>
<td>Hardstand and turnaround areas suitable for a 3.4 appliance (i.e. kerb to kerb 17.5 metres) are provided within three metres of each tank.</td>
</tr>
<tr>
<td>Couplings:</td>
<td>Tanks are to be fitted with a full flow gate (not ball) valve and a 100mm cam-lock coupling of metal/alloy construction (source: DFES). Examples below:</td>
</tr>
</tbody>
</table>

Ownership and Responsibility: Water tanks and associated facilities are vested in the relevant local government. A procedure must be in place to ensure that water tanks are maintained at or above designated capacity at all times.
Acceptable Solution 4.3 Non-Reticulated Areas - Individual Lots

This solution is only for use if creating one additional lot and cannot be applied cumulatively (Guidelines for Planning in Bushfire Prone Areas WAPC 2015 Appendix 4).

Single lots above 500 m$^2$ need a dedicated static water supply on the lot that has an effective capacity of 10,000 litres (Guidelines for Planning in Bushfire Prone Areas WAPC 2015).

An Example Local Government Requirement:

<table>
<thead>
<tr>
<th>Volume:</th>
<th>Minimum 10,000 litres (effective) per tank dedicated to firefighting purposes. The storage tank must not facilitate sharing the water for domestic use (danger of contamination).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tank Construction:</td>
<td>Above ground tanks constructed using concrete or metal.</td>
</tr>
<tr>
<td>Pipe Construction:</td>
<td>Galvanised or copper (PVC if buried 300mm below ground).</td>
</tr>
<tr>
